It has been found that a chamber diameter of more than 0.75 mm and less than 4 mm, or a chamber diameter average of at most 3 mm, renders the collagen sponge particularly useful for being coated with a fibrin glue preparation. Preferably, the collagen gel has a dry mass in the range of 2-20 mg dry mass per 1 g gel, such as 4-18 mg, such as 5-13 mg, such as 6-11 mg per 1 g gel. The dynamic viscosity of the collagen gel is preferably 2-20 Ncm, such as 4-10 Ncm, such as 6-8 Ncm. The collagen sponge preferably has a water content of not more than 20%, such as 10-15%, such as about 18%. The elasticity module of the collagen sponge is preferably in the range of 5-100 N/cm² ~~N/cm~~, such as 10-50 N/cm² ~~N/cm~~, and the density of the sponge is preferably 1-10 mg/cm³, such as 2-7 mg/cm³.

Please amend the paragraph on page 7, ^{line 13 to line 24}line 11, to line 22, as follows:

In a second aspect, the present invention relates to a method of preparing a collagen sponge, comprising the steps of:

- preparing a collagen gel,
- mixing air into the collagen gel, so as to obtain a collagen foam,
- drying the collagen foam, so as to obtain a dry block of collagen sponge having chambers therein,
- isolating, from the block of collagen sponge, parts of sponge having the following properties:
 - elasticity module in the range of 5 to 100 N/cm² ~~N/cm~~,
 - density in the range of 1 to 10 mg/cm³,
 - chamber diameter of more than 0.75 mm and less than 4 mm, or a chamber diameter average of at most 3 mm.
